

## Spring Medical Systems Selects Clinigence to Enhance

### Clinical Data Analytics Capabilities

Alliance between innovative software vendors provides real-time benchmarking reports to SpringCharts® EHR users

Atlanta, December 3, 2012—Clinigence, a next-generation clinical business intelligence technology provider, today announced a strategic alliance with Spring Medical Systems. Through this alliance, SpringCharts EHR users will leverage Clinigence’s collaborative analytics solution to generate timely, trackable reports that measure and visually represent clinical quality, patient outcomes and cost. This insight will enable providers to further enhance patient care while aligning with new value-based payment and coordinated care delivery models.

“Insight is critical as hospitals and physician practices look to take advantage of the many clinical and financial opportunities afforded to them in this new era of healthcare,” said Kobi Margolin, CEO of Clinigence. “We applaud Spring Medical’s commitment to value-based reporting and look forward to helping provide SpringCharts users with a ‘leg up’ as they pursue pay-for-performance, Meaningful Use (MU) and other initiatives.”

The Clinigence solution is built around several key capabilities, including clinical data analytics, data mining, predictive modeling and business intelligence. Leveraging cloud-based semantic collaboration, the solution fuels a continuous cycle of improvement in staff performance and process effectiveness while accelerating the creation of best practices.

“Having the most accurate patient data to report against, no matter the criteria, is more critical than ever,” said Mark Benvegna, president and CEO of Spring Medical Systems. “We’re thrilled to provide our SpringChart users with access to an advanced technology platform that will support their MU reporting requirements and their future analytics needs.”
